# Static Configurations Entrypoints

Static Config – Docker Provider

Static Config – Entrypoint Configurations

- Can be defined using TOML, YAML, or CLI

- Define which ports to listen for incoming connections/packets

- Redirect connections from HTTP to HTTPS

- Forward Header configuration

- Override default TLS with user-defined TLS

Static Config – Entrypoint YAML

```yaml
##################################################################
# Entrypoint
##################################################################
entryPoints:
  web:
    address: ":80"
  websecure:
    address: ":443"
```

Static Config – Entrypoint Redirects

```yaml
################################################################
# Entrypoint
################################################################

entryPoints:
  web:
    address: ":80"
    http:
      redirections:
        entryPoint:
          to: websecure
          scheme: https

  websecure:
    address: ":443"
```
